3rd December 2024

Plan

- Ocean
- Cryosphere
- Recent past and future
- Paleoclimate change
- Coastal oceans
- Surface ocean acidification

Processes and feedbacks

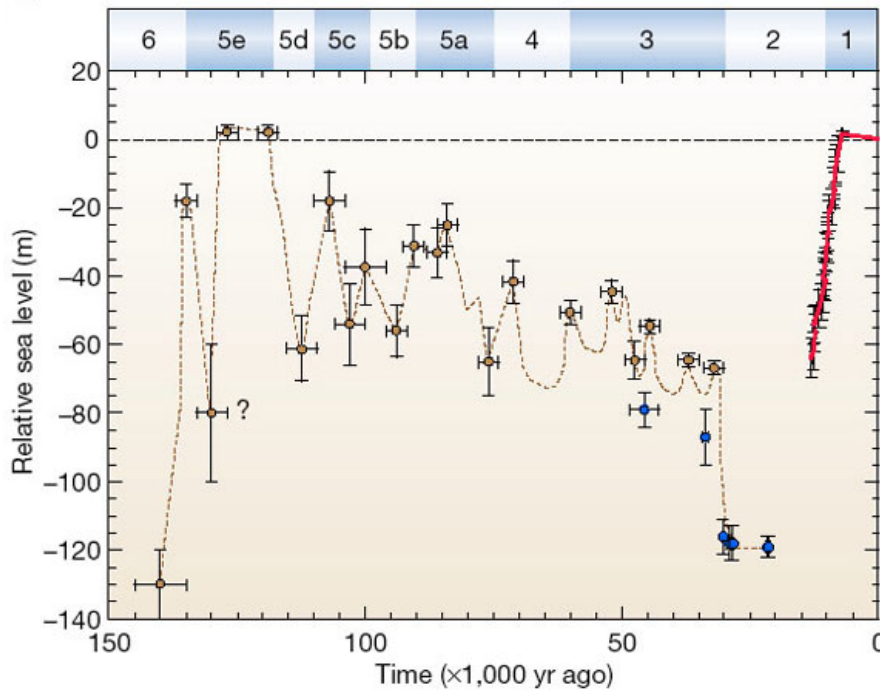

Historical Evolution of Sea Level

Glaciers: Fluctuations Since the Little Ice Age

Mountain Glacier Retreat: Impacts

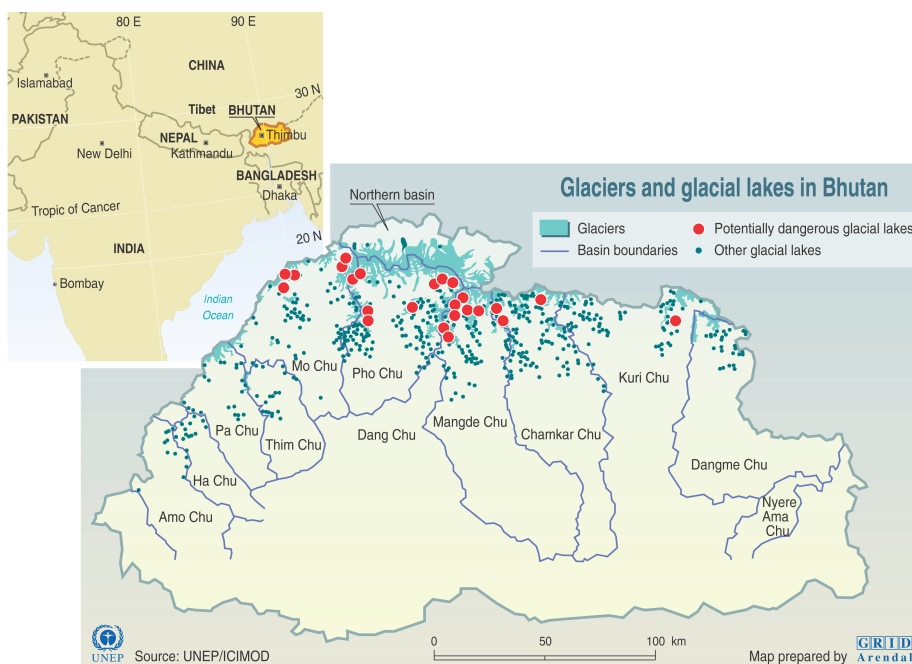

- short and medium term
 - rise of glacial lake levels
 - risk of mountain lake overflow
 - risk of rupture of moraine (natural) and artificial dams
 - Glacial Lake Outburst Floods (GLOF) or flash floods
 - reduced drinking water resources (next 20 to 30 years)
- long term
 - perturbation of the water cycle
 - contribution to global sea level rise
 - reduced hydroelectric power potential
 - reduced river discharge

Glacial Lakes in the Himalayas: Bhutan

Source: <http://www.grida.no>

Mountain Areas: a Few Guidelines

- ca. 500 million people live in mountain areas or on high plains
- about half of the World's population relies on drinking water supplied by mountain areas
- in arid and semi-arid zones, 70 to 95% of surface waters come from mountain areas
- mountain tourism represents 15 to 20% of the World tourism
- mountain ecosystems are inherently fragile

Ice Sheets and Potential Sea Level Rise

	Volume (10^{15} m^3)	Surface Area (10^{12} m^2)	Equiv. Δh (m)
Greenland	2.9	1.7	~ 7
East Antarctica	26.039	10.354	~ 60
West Antarctica	3.262	1.974	~ 6

Source: UNEP (2007), IPCC (2001)

Antarctic Ice Sheet

Source: Oppenheimer (1998)

Marine Ice Sheet Instability

- Ice flux at the grounding line (*ligne d'ancrage* or *ligne d'échouage* in French) of a marine ice sheet increases with the ice sheet's thickness at that place
- Sea level change may possibly perturb the position of the grounding line
⇒ Archimedes' principle – buoyant force acting onto the floating part
- If the ice sheet rests upon bedrock sloping towards the continental interior a sea level rise may trigger an ice sheet instability
- Other possible perturbation: viscosity change due to temperature change

Marine Ice Sheet Instability

Sea Ice Decrease

- Reduced extent
 - maximum extent
 - minimum extent
- Thickness changes (volume)
- Reduced multi-annual sea ice

Sea Ice Decrease in the Arctic

Global Sea-Level Budget: AR6 Analysis 1971–2018

Heat Content in the Climate System

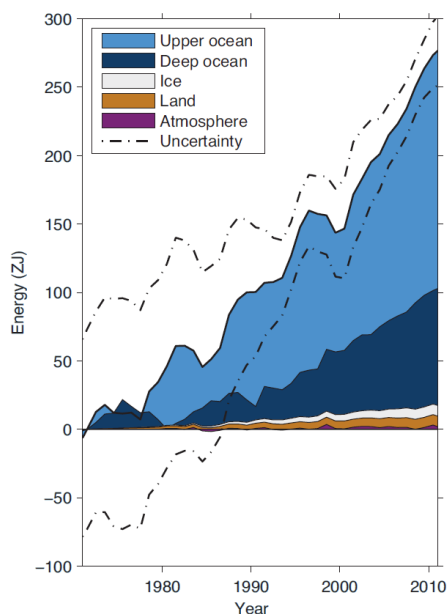

While we are Here: a Short Flashback . . .

Source: IPCC-WG1 (2013, Fig. 2.11)

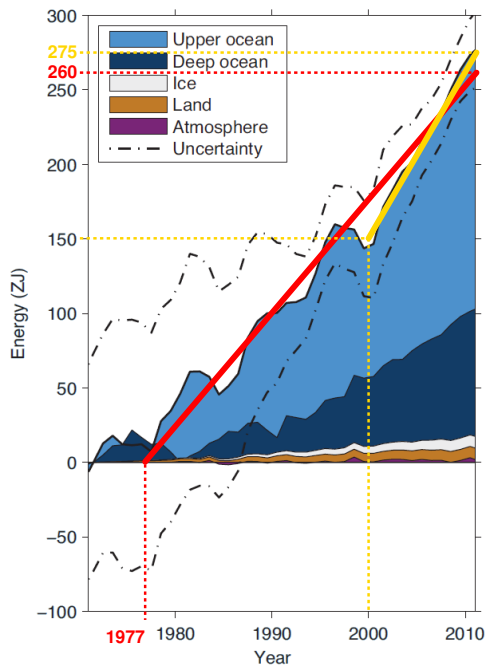

Heat Accumulation in the Climate System

- $1 ZJ = 10^{21} J$
- $A_{Earth} = 510.1 \times 10^6 km^2$
- ΔQ_1 : energy change per m^2 per yr for 1 ZJ

$$\begin{aligned} \Delta Q_1 &= \frac{10^{21} J}{A_{Earth} \times 1 yr} \\ &= \frac{10^{21} J}{5.101 \times 10^{14} m^2 \times 3.15576 \times 10^7 s} \\ &= 0.0621213 Wm^{-2} \end{aligned}$$

Heat Accumulation in the Climate System

1977–2011

260 ZJ in 34 yr \rightarrow 7.65 ZJ/yr

$$\Delta Q = 7.65 \times \Delta Q_1 = 0.48 \text{ Wm}^{-2}$$

2000–2011

125 ZJ in 11 yr \rightarrow 11.36 ZJ/yr

$$\Delta Q = 11.36 \times \Delta Q_1 = 0.71 \text{ Wm}^{-2}$$

Ocean Warming: Impacts on Coral Reefs

- Coral reefs can cope with rates of sea-level rise of up to 10 mm/yr
- Warming represents greater threat
- Bleaching if summer sea-surface temperature exceeds average maximum by 1 to 2 °C one year
- In case of repeated exceeding: death
- Other threats: pollution, ocean acidification

CO₂ Emissions by Human Activity

Guy Munhoven

Climate Change and Impacts

Cumulated Budget For CO₂ Emissions From 1800 to 1994

Sources and Sinks	1800 – 1994	1980 – 1999
Fossil fuels and cement production	240 ± 20	117 ± 5
Storage in the atmosphere	-165 ± 4	-65 ± 1
Ocean uptake	-118 ± 19	-37 ± 8
Net continent	39 ± 28	-15 ± 9
Emissions due to land-use change	100 – 180	24 ± 12
Net sequestration by terrestrial biosphere	-61 to -141	-39 ± 18

Units: 10¹⁵ g C (Sabine et al., 2004)

Climate Change and Impacts

Surface Ocean Acidification

Source: Caldeira and Wickett (2003)

Surface Ocean Acidification

Source: IMBER (2005, <http://www.imber.info>)

Acidification, Saturation: a Carbonate System Primer

Dissolution of CO₂ in water: release of acidity (H⁺ ions):

Acidification, Saturation: a Carbonate System Primer

Degree of saturation with respect to a carbonate mineral

$$\Omega_{\text{carb}} = \frac{[\text{Ca}^{2+}][\text{CO}_3^{2-}]}{K_{\text{sp carb}}}$$

where

- [Ca²⁺] and [CO₃²⁻] are the concentrations of Ca and CO₃²⁻
- $K_{\text{sp carb}}$ is the solubility product of the carbonate mineral
(= $f(S, T, P)$, different for each mineral)

If [Ca²⁺] and [CO₃²⁻] such that

- $\Omega_{\text{carb}} > 1$: super-saturation, precipitation of 'carb' possible
- $\Omega_{\text{carb}} = 1$: saturation
- $\Omega_{\text{carb}} < 1$: under-saturation, dissolution of 'carb'

Acidification, Saturation: a Carbonate System Primer

Dissolution of CO₂ in water: effect on CO₃²⁻

Accordingly

$$[\text{CO}_{2(\text{aq})}^*] \nearrow \Rightarrow [\text{CO}_3^{2-}] \searrow$$

$$\Rightarrow \Omega_{\text{carb}} = \frac{[\text{Ca}^{2+}][\text{CO}_3^{2-}]}{K_{\text{spcarb}}} \searrow$$

since [Ca²⁺] shows only little variation in general and *S*, *T* and *P* not affected by CO₂ dissolution

Surface Ocean Acidification: Impacts

- Early 2000s: ΔpH de $-0.1 \Leftrightarrow \Delta[\text{H}^+]$ of $+26\%$
- IS92a scenario: 788 ppm of CO₂ in the atmosphere by 2100, leading to ΔpH of $-0.4 \Leftrightarrow [\text{H}^+] \times 2.6$
- Decrease of the degree of saturation with respect to common biogenic carbonate minerals in surface waters
- By 2100: under-saturation with respect to aragonite bbin the Southern Ocean and in the subarctic Pacific
- Doubling of atmospheric CO₂ (560 ppm): degree of saturation with respect to aragonite decreased to 2.1 (from 3.4 at pre-industrial time) \Rightarrow calcification rate of corals and reef-building algae reduced by 10 to 50%
- Most calcareous organisms, neritic and pelagic, touched by this unfavourable evolution
